TIG201 AC/DC INVERTER TIG WELDER

OPERATION INSTRUCTIONS

Version 2014-1
Thank you for selecting the R-Tech Tig201 Inverter AC/DC TIG Welder.

The Tig201 has many benefits over traditional TIG welders, including 250Hz AC frequency adjustment, AC squarewave balance control, full pulse welding, slope up/down, remote foot option and an industrial 60% duty cycle.

We want you to take pride in operating our Tig201 as much pride as we have taken in making this product for you. Please read all information in this manual before operation.

**PLEASE EXAMINE CARTON AND EQUIPMENT FOR DAMAGE IMMEDIATELY**

When this equipment is shipped, title passes to the purchaser upon receipt from the courier. Consequently all claims for material damaged in shipment must be made by purchaser against the transportation company used.

Please record your equipment identification below for future reference. This information can be found on data plate at rear of machine.

Product TIG201
Serial No. _____________________________
Date of Purchase _______________________
Where Purchased ______________________

Whenever you request replacement parts or information on this equipment please always supply information you have recorded above.

This product is covered by 2 years parts and labour warranty, we will cover cost of collecting, repair and returning item to you (UK mainland only, other areas are RTB). External items, torch, earth lead etc are covered by 3 months warranty. Any faults/damage found caused by customer will be charged pro-rata.

Pay particular attention to the safety instructions we have provided you for your protection.

The level of seriousness to be applied to each section is explained below.

**WARNING**

This statement appears where the information must be followed exactly to avoid serious personal injury.

**CAUTION**

This statement appears where the information must be following to avoid a minor personal injury or damage to this equipment.
**Introduction**

The R-Tech Tig201 is a member of our field acclaimed family of welding products. Premium features include:-

1. Inverter power source – more efficient to operate, provides smoother weld characteristics.
2. AC squarewave frequency adjustment to 250Hz
3. AC squarewave balance control
4. Full featured pulse welding in both AC and DC modes
5. Patented HF Microstart – Reduces electronic interference to local area
6. Slope up / slope down
7. Remote foot pedal option
8. Digital amp meter
9. Industrial 60% Duty cycle at 200 Amps @ 40C

**Recommended Processes**

The R-Tech Tig201 is recommended for the TIG welding processes within its output capacity of 200 Amps

**Equipment Limitations**

The R-Tech Tig201 is protected from overloads beyond the output ratings and duty cycle as per machine specifications with thermostat protection of the output coils and rectifiers.

**Welding Capability – Duty Cycle**

The R-Tech Tig201 is rated at 200 Amps at 60% duty cycle on a ten minute basis. If the duty cycle is exceeded a thermal protector will shut machine off until the machine cools.

**Technical Specifications**

Safety Precautions

Read entire section before starting installation

**WARNING!**

Electric Shock can kill – Only qualified personnel should perform this installation. Turn off input power at the fuse box before working on this equipment. Do not touch electrically live parts. Always connect the machine to an earthed mains supply as per national recommended standards.

**Select suitable location**

Place the welder where clean cooling air can freely circulate in and out of the front & rear louver vents. Dirt, dust or any foreign material that can be drawn through vents into welder must be kept to a minimum. Failure to observe these precautions can result in excessive operating temperatures which can lead to plant failure.

**Grinding**

Do not direct grinding particles towards the welder. An abundance of conductive material can cause plant failure.

**Stacking**

This machine cannot be stacked.

**Transport – Unloading**

Never underestimate the weight of equipment, never move or leave suspended in the air above people. Use recommended lifting equipment at all times.

**WARNING!**

Falling Equipment can cause injury. Never lift welder with gas bottle attached. Never lift above personnel.

**Tilting**

Machine must be placed on a secure level surface or on a recommended undercarriage/trolley. This machine may topple over if this procedure is not followed.

**Environmental Rating**

The welding power source carries the IP21S rating. It may be used in normal industrial and commercial environments. Avoid using in areas where water / rain is around.

Read and follow the 'Electric Shock Warnings' in the safety section if welding must be performed under electrically hazardous conditions such as welding in wet areas or water on the work piece.
Electrical Installation

WARNING! ELECTRIC SHOCK CAN KILL

Machine grounding and High Frequency Interference Protection

This welder must be grounded to earth. See national electrical codes for proper grounding methods.

The high frequency generator being similar to a radio transmitter may cause interference to radio, TV and other electronic equipment. These problems may be the result of radiated interference. Proper grounding methods can reduce or eliminate this.

Radiated interference can develop in the following ways

1. Direct interference from welder power source
2. Direct interference from the welding leads
3. Direct interference radiated from feedback into power lines
4. Interference from re-radiation by un-grounded metallic objects.

Keeping these contributing factors in mind, installing equipment as per following instructions should minimize problems.

1. Keep the welder input power lines as short as possible and enclose as much of them as possible in metal conduit or equivalent shielding. There should be a good electrical contact between this conduit and ground (Earth).
2. Keep the work and electrode leads as short as possible. Tape the leads together where practical.
3. Be sure the torch and earth leads rubber coverings are free from cuts and cracks that allow welding power leakage.
4. Keep earth lead connection to work in good condition – Clean area on workbench where earth clamp is situated on a regular basis.

Input Connections

Make sure the voltage, phase and frequency of input power is as specified on machine rating plate located at rear of machine.

Have a qualified electrician provide suitable input power as per national electrical codes. Make sure machine is earthed / grounded.
Make sure fuse or circuit breaker is correct rating for machine. Using fuses or circuit breakers smaller than recommended will result in ‘nuisance’ shut off from welder inrush currents even if welding at low amperages.

Failure to follow these instructions can cause immediate failure within the welder and void machines warranty.

Turn the input power OFF at the mains switch & fuse box before working on this equipment.

Have a qualified electrician install & service this equipment.

Allow machine to sit for 5 minutes minimum to allow the power capacitors to discharge before working inside this equipment. Do not touch electrically live parts

The TIG201 Inverter TIG Welder requires a 240V 50/60Hz supply. It requires a 16A supply for TIG operation and a 28A supply for MMA welding. It comes with a 3 metre mains cable attached.

Connect wires according to national coding.

Brown wire – Live
Blue wire – Neutral
Green/Yellow Wire – Earth (Ground)

**Connecting to a mains electrical supply**

**THIS MACHINE IS OF AN INDUSTRIAL SPECIFICATION AND MUST BE FITTED TO A 16AMP 240V MAINS INPUT**

**Connecting to an Engine Driven Generator**

If connecting this machine to an engine driven generator please ensure the following

Minimum Generator KVA Output – 6.5 KVA continuous

Generator to be fitted with AVR (automatic voltage regulation)

**DO NOT USE ON A GENERATOR WITHOUT AVR**

Connecting to a generator without the above minimum requirements will invalidate your warranty.
Connections for Tig201

Rear machine connections

1. **On/Off Switch**
2. **Auxiliary 240V AC output**
   - For water cooler – Maximum load 3A – Do not connect to power tools etc
3. **Fuse Holder**
   - 3A fuse for water cooling socket
4. **Mains input cable**
   - Fit required plug as per your electrical installation
5. **Gas input connector**
   - Connect input gas hose ensuring connection is tight
6. **Earth for chassis**
   - If experiencing localized interference when using machine, connect workbench to this point using correct graded earth wire (not normally used)
Connections for TIG (GTAW) Welding

1. **Positive power connector +**
   Connect the earth lead to by inserting and twisting until tight and the earth clamp to work/bench.

2. **Gas outlet**
   Connect the torch gas hose

3. **Negative power connector -**
   Connect TIG Torch Dinze to power connector by inserting and twisting until tight

4. **Torch control socket 7-Pin**
   Connect torch control plug

To avoid a High Frequency shock keep the TIG torch in good condition and replace if any of the insulation is damaged.

Connect the gas input hose to gas regulator and use ‘Pure Argon’ Gas, available from local suppliers. Set gas flow/pressure to 8-12 LPM.

Make sure gas bottle is secured to avoid injury.

**Remote Foot Pedal connection.**

Disconnect TIG Torch switch plug from torch control socket (Fig2.4) and connect plug from foot pedal.
Connections for STICK MMA (SMAW) Welding

1. **Positive power connector +**
   
   Connect the electrode holder by inserting and twisting until tight.

2. Not used in MMA mode

3. **Negative power connector -**
   
   Connect the earth lead to by inserting and twisting until tight and the earth clamp to work/bench.

4. Not used in MMA mode
Controls and Settings

1. **Base current control**
   This adjusts the main welding current and is shown in L.E.D (Fig 4.11)

2. **Pulse peak current adjustment**
   This sets pulse amperage and must be set above the base (main) current amperage. If set to zero pulse welding is disabled.

3. **Pulse frequency adjustment**
   This sets how often pulse will occur 0.5 – 25hz

4. **Up slope**
   Adjustment 0-10 seconds. The main welding current raises from minimum amperage to main current selected in time selected when weld started
5. **Pulse width**

Pulse width adjustment – This sets length of pulse 0.1 – 0.9 seconds

6. **Down slope**

Down-Slope adjustment 0-10 seconds. The main welding current decreases from main amperage to minimum amperage in time selected when weld finished

7. **AC – DC Selector switch**

This switch selects either DC for welding steels or AC for welding alloys

**DO NOT SWITCH WHEN WELDING AS DAMAGE TO MACHINE CAN OCCUR.**

8. **2/4 Way selector switch**

2/4 Step trigger mode switch – TIG welding can either be done in 2 or 4 step mode.

When the trigger mode is in the 2 step position the following sequence will occur

**Press and hold the TIG torch switch to start sequence.**

The machine will open gas valve to start flow of shield gas, after a 0.5 seconds pre-flow time to purge air from torch hose the welding output of machine will be turned on and the arc will be started. After the arc is started the output current will increase from the start (min) current to base (main) current in time selected by slope-up.

Release the TIG torch switch to end sequence.

The machine will now decrease output to finish (min) current in time set by slope-down, once at finish (min) current the machine will stop output and the gas valve will continue to operate for the selected time (post flow)

Possible variations of this standard sequence are shown in diagram below. It is possible to press and hold TIG torch switch a second time during downslope time to restart. After the switch is pressed the output current will raise to base (main) current
When the trigger mode is in the 4 step position the following sequence will occur

Press and hold the TIG torch switch to start sequence.

The machine will open gas valve to start flow of shield gas, after a 0.5 seconds pre-flow time to purge air from torch hose the welding output of machine will be turned on and the arc will be started. After the arc is started the output current will be at start (min) current

This condition can be maintained as long as required.

Release the TIG torch switch to go to step 2

The machine will now increase output to base (main) current in time set by slope-up.

Press and hold the TIG torch switch when main weld is complete

The machine will now decrease the welding output current to finish (min) in down-slope time set. Once at finish (min) output you can release the TIG torch switch to end weld the gas post-flow will continue to run for set time.

9. **MMA – TIG mode switch**

MMA-TIG mode switch. Switches between TIG (GTAW) & MMA STICK (SMAW) welding

10. **AC squarewave frequency adjuster**

AC Squarewave frequency adjustment 20-250Hz.

Traditional TIG welders have a fixed frequency of 60Hz, the TIG201 advanced technology allows AC frequency adjustment from 20-250hz, as you turn up the frequency the width of arc from tungsten decreases allowing more control of weld pool and an increase travel speed

The pitch noise of weld will increase when AC frequency is turned up, this is normal.

100 - 120Hz is the ‘sweet spot’ for most AC welding.

11. **LED Display**

3 digit LED meter is used to display the pre-set (before welding) amperage and actual amperage (when welding).
12. **Gas post flow adjustment**

Gas post flow adjustment 1 – 25 seconds. The gas keeps flowing after weld has finished, this cools & stops tungsten from getting contaminated.
Note: Gas pre-flow time is fixed at 0.5 seconds in TIG mode but no pre-flow time will occur if the arc is restarted during post flow time as gas is already flowing.

13. **AC Squarewave balance (SP%)**

SP% AC Squarewave balance control is adjustable from 30% – 70%
Set at 50% this provides balanced control for AC Welding. The machine spends 50% of cycle in positive mode which lifts the oxide surface off the work (power flows from workpiece to tungsten) and 50% in negative mode which penetrates the work (power flows from tungsten to workpiece)

30% is maximum penetration, the machine is more torch negative - 30% positive / 70% negative.

70% is maximum cleaning, the machine is more torch positive - 70% positive / 30% negative

With clean metal you can select more penetration and the machine will spend more time penetrating work (negative part of cycle).

When welding dirty/contaminated material more cleaning may need to be selected, the machine will spend more time lifting coating off the work (positive part of cycle).

For most AC welding we suggest you set machine to about 40% SP. This means 40% of weld cycle is positive (cleaning) and 60% of weld is negative (penetration)

Tip. If you are welding close to the tungsten limits, I.E 160amps on a 2.4mm tungsten and the end of tungsten is wobbling and falling off, turning down the SP% will give better tungsten stability as the current is flowing from tungsten giving more penetration (negative part of cycle - more penetration)

In AC mode if you set machine to 30%, maximum penetration and set the AC frequency to 150Hz or above, you can grind the tungsten tip to a point to give a much narrower arc and the tungsten will stay sharper for longer.

14. **Arc force (Stick – SMAW only)**

This provides better arc starting when in MMA stick mode, useful when you are welding dirty/rusty material or cold/damp welding electrodes
Operating machine

SAFETY PRECAUTIONS

WARNING!

ELECTRIC SHOCK CAN KILL

Do not touch electrically live parts or electrode with skin or wet clothing.
Insulate yourself from work and ground
Always wear dry insulating gloves

WARNING!

FUMES AND GASES can be dangerous

Keep your head out of fumes & gases produced from welding.
Use ventilation or exhaust to remove fumes & gases from breathing zone and general area.

WARNING!

WELDING SPARKS can cause fire or explosion

Keep flammable material away from work area.
Do not weld on containers that have held combustibles

WARNING!

ARC RAYS can burn

Wear eye, ear and body protection – Make sure work area is protected by proper shielding to avoid injury to passers by.
**Welding in TIG mode – No Pulse – No remote foot pedal**

1. Connect the TIG torch and earth lead to machine & work piece.
2. Set the TIG/MMA switch to TIG
3. Select either DC (steel) or AC (alloys)
4. Select 2 or 4 way torch operation
5. Connect Argon gas and set flow to approx 8-12 LPM
6. Set Gas post flow to 10 Seconds
7. Adjust Base current to desired welding current
8. Set Pulse current, width & Freq to minimum setting (pulse off)
9. If welding on AC set AC Frequency to 100hz and SP% to 50
10. Press the TIG torch switch to start welding

**Welding in TIG mode – with Pulse – No remote foot pedal**

1. Connect the TIG Torch to machine, connect earth lead to machine & work piece.
2. Set the TIG/MMA switch to TIG
3. Select either DC (steel) or AC (alloys)
4. Select 2 or 4 way torch operation
5. Connect Argon gas and set flow to approx 8-12 LPM
6. Set Gas post flow to 5 Seconds
7. Adjust Base current to desired welding current.
8. Adjust Pulse current to desired setting
9. Adjust Pulse width to desired setting
10. Adjust Pulse freq. to desired setting
11. If welding on AC set AC Frequency to 100Hz and SP% to 50
12. Press the TIG torch switch to start welding

Notes: When welding with Pulse, the pulse amperage must be set higher than the base amperage.

The LED display will show Pre-set amperage with base and pulse current settings.

The benefits of pulse welding is the ability to control the weld pool and amount of heat absorbed by work resulting in a smaller heat affected zone which results in fewer deformations and reduced chance of cracking.

There are no set rules for pulse welding as this is down to personal choice by the welder.

**Welding in TIG mode – with Remote foot pedal**

1. Connect the Tig Torch to machine, connect earth lead to machine & work piece.
2. Connect remote foot pedal to machine
3. Set the TIG/MMA switch to TIG
4. Select either DC (steel) or AC (alloys)
5. Select 2 way torch operation
6. Connect Argon gas and set flow to approx 8-12 LPM
7. Set Gas post flow to 5 Seconds
8. If welding on AC set AC Frequency to 100Hz and SP% to 50
9. Adjust base current knob to desired maximum welding current that foot pedal will go to
10. Press the foot pedal to start welding.
**Note: When welding with remote foot pedal**

Pre-set amperage in LED display will show what the maximum amperage foot pedal will go to (what base amperage control knob is set to), upon welding it will show actual welding amperage.

Upon pressing of foot pedal welding arc will start, if you find it hard to start arc push pedal down a bit further to aid starting.

The benefits of welding with remote foot pedal is greater control of amount of heat going into work especially beneficial on alloys as these absorb the heat much quicker than steel. Press pedal fully to start weld, upon weld pool formation you can slightly release the pedal to decrease amperage to sustain perfect weld pool and increase again as required to sustain weld characteristics.

The foot pedal adjusts from Start (min) current to Max current set on base current knob on front of machine as shown in LED before welding.

**Tips for AC Welding**

The TIG201 offers two significant advantages over conventional silicon rectifier SCR transformer power sources.

1. The AC square wave balance (SP%) can be set to a higher percentage electrode negative (decrease below 50%) which minimizes tungsten heating and erosion

2. The AC square wave frequency can be varied to focus the arc and achieve quicker travel speed

   Increasing the AC frequency above 60Hz will narrow the cone shape arc from the tungsten's tip.

   Decreasing the AC frequency below 60Hz will broaden the cone shape arc from tungsten's tip.

![120 Hz](image1) ![60 Hz](image2)

The two above benefits above can be used to maintain a tight focus of arc for precise heat control & tight joint access. Because of the TIG201 Inverter Technology the following recommendations are made as a starting point.

The other benefits are quicker travel speed the higher the AC frequency, thus increasing output

A 2% thoriated tungsten is recommended instead of pure tungsten normally used for AC welding.

Thoriated tungsten’s emit electrons easier and therefore will improve starting.
Tungsten size / amperage guide

All values below are based on using pure argon shielding gas. Other current values may be employed depending on the shielding gas and application

<table>

Welding in STICK MMA (SMAW) Mode

1. Fit MMA electrode holder to machine
2. Fit earth lead to machine and to work piece
3. Select MMA on MMA/TIG switch
4. Select DC or AC (DC is most commonly used)
5. Place electrode in holder
6. Select desired welding base current
7. Select desired Arc Force
8. Strike arc and weld

WARNING!

ELECTRIC SHOCK CAN KILL

When machine is switched to MMA mode, output terminals are always live, take care and do not touch electrode and earth by person at same time, otherwise electric shock will occur.

The foot pedal has no affect on welding current in MMA mode and the gas flow and high frequency starting circuit is disabled.
**Maintenance**

**Routine and periodic maintenance**

**WARNING!**

**ELECTRIC SHOCK CAN KILL**

Turn the input power OFF at the mains switch & fuse box before working on this equipment.

Have a qualified electrician install & service this equipment.

Allow machine to sit for 5 minutes minimum to allow the power capacitors to discharge before working inside this equipment.

Do not touch electrically live parts

1. Periodically remove the side/top panels of machine and clean out machine with a low pressure dry air line paying particular attention to PC Boards, Fan blades, HF points
2. Inspect input and output cables & hoses for fraying, cuts & bare spots
3. Keep TIG torch and cables in good condition
4. Clean air vents to ensure proper air flow and cooling
5. The fan motor has sealed bearings which requires no maintenance

**Troubleshooting**

Service & repair should only be performed by R-Tech welding trained personnel. Unauthorised repairs performed on this welding equipment may result in danger or injury to the technician and machine operator and will invalidate your warranty.

For your safety and to avoid electric shock, please observe all safety notes and precautions detailed throughout this manual.

The troubleshooting guide is provided to help you locate possible machine malfunctions

If fault / problem is not listed below check our [Tig Welder Support](http://www.r-techwelding.co.uk/support.php) page on our website

or contact R-Tech by phone. Contact details can be found on front of this manual and our website
**Tig welding problems**

- **No output** - **Power light is not lit**
  
  Check machine on/off switch is in the 'on' position  
  Check Input power to machine  
  Check plug wiring  
  Check mains trip / fuses

- **No output** - **Fan runs** - **Power light is lit**
  
  Check torch connections are secure and torch switch operation, try replacing TIG torch.  
  
  If you have a multi-meter check continuity between pins 1 and 2 on torch switch plug when pressing torch switch

- **No output** - **Power light is lit** - **Warning light is lit**
  
  Welding application may have exceeded recommended duty cycle, allow machine to cool down until the warning light goes out.

- **No output** – **Power light is lit** – **Gas at torch end when trigger pressed**
  
  Check torch condition – possible break in torch power cable – replace torch

- **Machine keeps overheating** - **Warning light is lit on machine**
  
  Check if fan is running – if not contact R-Tech for repair  
  
  Check the cooling vents for obstruction, blow out machine with clean dry low pressure air supply. Check for adequate ventilation around machine

- **Porosity in weld** – **No / low gas at torch tip**
  
  Check gas supply from gas bottle  
  Check flow rate on regulator  
  Check gas hose for restrictions  
  Check for draughts in local area, open doors etc  
  Replace TIG torch – may have gas restriction

- **Poor weld penetration**
  
  Check condition of earth lead and clamp and ensure clamp is connection via a clean area on work piece  
  
  Check condition of TIG torch, try other TIG torch
- **Machine stuck on minimum amps when welding although higher amperage has been set**
  
  Make sure machine has not been set to 4-way operation as when in this mode when you press torch switch you get minimum amps and when you let go of switch machine will go to maximum amps set.

- **When using foot pedal machine is stuck on minimum amps**
  
  Make sure 2/4 way switch is in 2 way position, the remote foot pedal will not work in the 4-way position, this is for torch switch operation only.

- **Output current reduced significantly when AC balance control knob is set near or on max setting or when base current is set near or at max output**
  
  Input power to machine doesn't have sufficient capacity. Try changing input power to a sufficient supply, refer to installation section
  
  or. Machine is powered from engine generator. If welding at high currents are required try switching to fixed mains supply
  
  or. Set AC balance (SP%) to 50 position

- **Arc ‘Flutters’ when TIG welding**
  
  1. Tungsten electrode may be too large in diameter for the current setting.
  
  2. Tungsten not sharp when in DC mode
  
  3. Gas shielding flow may be low or high, check gas flow, reduce tungsten stick out beyond ceramic
  
  4. Check for leaks in torch & gas hoses

- **Black areas along weld bead**
  
  1. Clean any oily or organic contamination from the work piece
  
  2 Tungsten electrode contaminated. Replace or sharpen
  
  3 Check for leaks or contamination on gas hoses & connections.
  
  4 Gas flow may be insufficient, Increase gas flow, reduce tungsten stick out from ceramic

- **Weak HF – Poor arc striking – welding output normal**
  
  1 Check torch and earth connections – is torch cable insulation in good condition.
  
  2 Check for leaks or contamination on gas hoses & connections.
  
  3 Gas flow may be insufficient, increase gas flow, reduce tungsten stick out from ceramic
  
  4 Keep output cables short as possible
• **HF spark is present at the tungsten electrode but unable to start welding arc,**
  Machine has normal welding output
  1 Tungsten may be contaminated - replace or sharpen
  2 The current may be set too low
  3 Tungsten may be too large for process
  4 Gas flow may be insufficient, increase gas flow, reduce tungsten stick out from ceramic

• **No HF when torch trigger pressed, no blue spark between HF points**
  Examine and clean HF points with clean dry low pressure air line
  HF PCB faulty – Contact R-Tech for repair

**MMA Stick welding problems**

• **Stick electrode ‘blasts off’ when arc is struck**
  Welding current set to high, reduce amperage or use thicker electrode
  Contaminated electrodes or material

• **Electrode sticks in weld puddle**
  Welding current is set too low
  Arc is too short, keep electrode further away from work

• **Excessive splatter**
  Too long an arc, keep electrode closer to work

• **Poor penetration**
  Travel speed too fast
  Too much welding current, reduce welding amperage

• **Porosity in weld**
  Electrodes are damp
  Arc too long, get electrode closer to work
